(54) Title: LUMINESCENT DEVICE

(57) Abstract: The present invention provides a luminescent device (1) comprising a gaseous tritium light source (GTLS) (3). The GTLS (3) is held within a housing (2) which may optionally be located in an outer casing. A filter, such as a neutral density filter, may be used to modify the light output to predetermined levels. The device may be used to calibrate apparatus used to measure optical output, such as a luminometer.

Box II Observations where certain claims were found unsearchable (Continuation of Item 2 of first sheet)
This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:
1. Claims Nos.: because they relate to subject matter not required to be searched by this Authority, namely:
Claims Nos.:     because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:
3. Claims Nos.: because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).
Box III Observations where unity of invention is lacking (Continuation of Item 3 of first sheet)
This International Searching Authority found multiple inventions in this international application, as follows:
see additional sheet
1. As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.
2. As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:
4. No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:  1-12
Remark on Protest  The additional search fees were accompanied by the applicant's protest.  No protest accompanied the payment of additional search fees.

#### FURTHER INFORMATION CONTINUED FROM PCT/ISA/ 210

This International Searching Authority found multiple (groups of) inventions in this international application, as follows:

1. claims: 1-12

A luminescent device comprising a gaseous tritium light source (GTLS) which provides a light output of pre-determinable intensity. Further, a casing, its materials, filter and colouring means for the device.

2. claims: 13-15

A kit comprising two ore more luminescent (GTLS) devices, whereby each light output is of distinct intensity. A magnetic handling tool.

3. claims: 16,17

A light measuring apparatus comprising a luminescent (GTLS) device housed in a sample holder of an apparatus as e.g. a luminometer, flourometer, spectrophotometer, etc.

4. claims: 18,19

A method of analysing a sample comprising the steps of using an GTLS device to calibrate an apparatus able to detect a light output, and inserting a sample into the apparatus and obtaining a reading therefore. The sample comprises living cells.

(54) Title: LUMINESCENT DEVICE

(57) Abstract: The present invention provides a luminescent device (1) comprising a gaseous tritium light source (GTLS) (3). The GTLS (3) is held within a housing (2) which may optionally be located in an outer casing. A filter, such as a neutral density filter, may be used to modify the light output to predetermined levels. The device may be used to calibrate apparatus used to measure optical output, such as a luminometer.

Luminescent Device

2	
3	The present invention relates to a luminescent
4	device comprising a gaseous tritium light source.
5	The device may be used, for example, to calibrate
6	luminometers and other scientific apparatus
7	measuring optical output.
8	
9	Different types of scientific apparatus may be used
10	to measure optical readings and frequently find
11	utility in chemistry, biochemistry, biotechnology
12	and medicine. Such optical readings are an
13	effective, reliable and safe method for detection
14	and analysis of molecules and living cell dynamics.
15	Luminometers are one example of such scientific
16	apparatus, and are used to measure the luminous
17	output or luminescence of samples. The luminometer
18	is based on a light-sensitive device termed a
19	photomultiplier.
20	

1	Other examples of light measuring equipment include
2	a CCD (Charge Coupled Device) camera based imaging
3	device such as the "Berthold Night Owl", a
4	scintillation counter, photomultiplier, a
5	fluorometer, a spectrophotometer and a photodiode
6	(in particular an avalanche photodiode).
7	
8	It is important that apparatus reliant on optical
9	analysis is regularly calibrated to ensure
10	consistency of results. Current optical apparatus
11	calibration devices may comprise a plurality of
12	light emitting diodes of varying intensities. The
13	apparatus is calibrated by checking that the
14	reading of the apparatus corresponds to the known
. 15	intensity of the light emitted from each of the
16	light emitting diodes. Such calibration is also
17	important when cross-referencing results from
18	different machines.
19 .	
20	These known calibration devices are expensive, and
21	require a power source. This renders them
22	relatively untransportable. The known calibration
23	devices are also bulky and occupy the entire sample
24	space allocated in the apparatus. Thus during
25	calibration of the apparatus, testing must be
26	stopped to insert the calibration device into the
27	apparatus. It is not therefore possible to check
28	the calibration of the machine whilst measuring
29	test samples. There is thus a risk that the
30	accuracy of the apparatus may decrease between
31	calibrations, i.e. during testing, so that test
32	results may be less accurate than is desirable.

WO 94/05983 discloses a multi-photomultiplier which 1 utilises a radioactive material to provide a light 2 output. Each photomultiplier component of the 3 multi-photomultiplier described in WO 94/05983 is 4 calibrated against another photomultiplier in the 5 same multi-photomultiplier. 6 7 According to a first aspect of the present 8 invention there is provided a luminescent device 9 comprising a gaseous tritium light source (GTLS) 10 which provides a light output of pre-determinable 11 intensity. 12 13 Tritium (3H) is a radioactive gas that emits 14 electrons which produce light through scintillation 15 when they collide with a phosphor substance. 16 Tritium has a half-life decay of (12.43 +/- 0.05) 17 years and after this time the activity of the 18 tritium source (and thus its luminescence) is 19 decreased by half. The intensity of the light 20 output will slowly decrease over time in accordance 21 with this half-life decay. As the date of 22 manufacture of the luminescent device is known, the 23 half-life correction may be accurately calculated. 24 The half-life correction may be calculated by means 25 of a computer programme or from a half-life graph. 26 27 Thus, in contrast to WO 94/05983 discussed above, 28 the present invention relates to a device where a 29 gaseous tritium light source provides a light 30 output of predeterminable intensity. The equipment 31 to be tested is compared to a light source of pre-32

determinable intensity rather than being tested 1 2 relative to another photomultiplier. 3 Preferably a number of distinct devices according 4 5 to the present invention are provided, each 6 providing a different pre-determinable light intensity. This facility for having a range of 7 8 different pre-determinable light outputs is 9 especially useful in the calibration of scientific 10 apparatus measuring optical output, for example a luminometer, and enables calibration of the 11 12 apparatus across the whole required range of light 13 intensity. To achieve reduced light intensity, the 14 device of the invention may comprise a light filtering means which predeterminably alters the 15 intensity of the light output to produce a reduced 16 17 light output. Suitable light reducing means 18 include a neutral density filter, and the use of 19 differing neutral density filters (e.g. of 1.0 giving 10% transmission; 2.0 giving 1% 20 21 transmission) allowing the luminescence of the 22 device to be reduced by a predetermined amount. 23 Desirably the light outputs are selected to test the accuracy of the apparatus across the whole 24 25 range of light intensity measurable. Where a luminometer is to be calibrated using one or more 26 27 devices according to the present invention, preferably the device or devices will test the 28 29 accuracy of the luminometer from at least 400 to 30 650 nm, suitably from at least 450 to 610 nm. 31

1	The luminescent device is desirably small enough to
2	be housed in a sample holder of the scientific
3	apparatus (e.g. luminometer, fluorometer,
4	spectrophotometer, CCD camera, photodiode (like an
5	avalanche photodiode), photomultiplier,
6	scintillation counter or the like).
7	
8	Preferably the luminescent device is shaped and
9	sized to be suitable for insertion into an
10	individual well of a standard size well plate, for
11	example a 96, 384 or 1536 well plate. As the
12	luminescent device of the present invention is
13	small enough to be housed in a single well of a
14	sample holder of a luminometer or other scientific
15	apparatus measuring optical output, it is possible
16	for the luminescent device to be left in the
17	apparatus during use, even when other wells contain
18	test materials.
19	
20	The calibration of the scientific apparatus can
21	therefore be checked for accuracy at each instance
22	of use of the luminescent device of the present
23	invention.
24	
25	The luminescent device of the present invention may
26	typically comprise the GTLS sealed in a housing
27	which is not easily broken under normal working
28	conditions. Suitably the housing is shatter, heat,
29	cold and moisture resistant. Whilst the housing
30	may be formed of any suitable material, examples
31	include aluminium, brass, steel, plastics (e.g.

polypropylene, acrylics and the like), carbon fibre

30 31

and ceramics. However at least one portion of the 1 inner housing will usually be transparent or 2 translucent (i.e. permits transmission of 3 luminescence) and is unreactive to tritium. 4 Mention may be made of glass (for example sapphire 5 glass), plastic or a combination of these 6 materials. Alternatively, the housing may include 7 an aperture through which the light output is 8 In this embodiment, the GTLS will be measured. 9 retained within the housing by a suitable means, 10 e.g. snug fit of the GTLS within the inner surface 11 or, more usually an adhesive material and generally 12 an outer casing including a transparent or 13 translucent portion will be present. 14 15 Optionally, the housing for the GTLS is itself 16 placed into a chamber of an outer casing having at 17 least one optically transparent or translucent 18 portion to permit transmission of the luminescence 19 from the tritium source. The outer casing 20 facilitates easy handling of the housing which is 21 generally small and also acts as a suitable 22 receptacle for holding any light filter required. 23 The outer casing is typically formed from metal, 24 preferably stainless steel, although other 25 materials (e.g. brass, aluminium, plastics, 26 ceramics etc) can also be used. The transparent or 27 translucent end is suitably formed from glass or 28

plastic. Optionally the transparent or translucent

end comprises a neutral density filter.

1 The luminescent device may comprise colouring means 2 to alter the colour of the light output to produce a coloured light output. 3 4 Typically the GTLS comprises 10 to 20 mCi of 5 tritium, suitably 15 to 20 mCi, preferably 18 mCi 6 (0.666 GBG) of tritium. A suitable GTLS for use in 7 the present invention is available commercially 8 from mb-microtec ag (Niederwanger, Switzerland). 9 10 In one embodiment the luminescent device according 11 to the invention is sized and shaped to fit within 12 a well in a well plate or the like. 13 embodiment, the GTLS will normally be located 14 within an inner housing which itself will be 15 located within an outer casing. For convenience of 16 handling (and especially removal of the device for 17 the well) the outer casing will be of a magnetic 18 material, such as steel. Optionally, the GTLS is 19 20 located within the inner housing in a snug fit, so that the ends of the GTLS are not able to emit 21 light and this improves the accuracy of the device 22 for calibration or comparitive purposes. The GTLS 23 will typically be  $4.5 \text{ mm} \times 1.6 \text{ mm}$ . 24 25 In an alternative embodiment the GTLS may be fixed 26 within a single housing and an array of filters 27 spaced along the length of the GTLS. Conveniently 28 29 the filters will be arranged in order of optical density. In this embodiment, the array of filters 30 in a single device facilitates calibration of a 31 microscope or CCD camera, and use of a single light 32

1 source ensures calibration across the different 2 filters. 3 In a further embodiment a scalebar graticule may be 4 etched onto a filter so that the device may be used 5 for measurement, typically of a sample viewed by a 6 microscope or CCD camera. Photolithography may be 7 used to manufacture the scalebar and the scale may 8 be shown in mm or  $\mu m$  depending upon the apparatus. 9 10 According to a further aspect of the present 11 invention there is provided a kit comprising two or 12 more luminescent devices as described above, each 13 providing a light output of pre-determinable and 14 distinct intensity. Thus each of the luminescent 15 devices provides a light output of a different pre-16 17 determinable intensity to the other devices present in the kit, and suitably the different intensities 18 provided span the entire range of light intensity 19 measurable by the scientific apparatus. 20 21 22 Optionally, the kit comprises 3, 4, 5, 6, or more devices, for example may contain 10, 12, 15 or 20 23 devices. 24 25 The kit may also include indicia recording the 26 date(s) of manufacture of the devices, and means to 27 calculate the intensity of the light output at any 28 time from the date(s) of manufacture. 29 30 In some embodiments it may be desirable for the 31

device of the present invention to include a

1	magnetic component. The presence of a magnetic
2	component allows the use of a magnetic handling
3	tool and is especially useful for facilitating
4	removal of small devices of the present invention
5	from wells, such as from the well of a 96 well
6	plate. Conveniently the magnetic component may be
7	provided by use of an outer casing of a magnetic
8	material such as steel.
9	
10	The kit may also comprise colouring means to alter
11	the colour of the light output. Suitably the light
12	output of each luminometer calibration device is
13	altered by the colouring means, to a different
14	colour, and the kit provides a range of coloured
15	light outputs.
16	
17	Preferably the colouring means comprises one or
18	more phosphors. Suitably the colouring means is
19	provided by a phosphor coating on the GTLS housing.
20	
21	According to a further aspect of the present
22	invention there is provided a colourimetric
23	equipment calibration device having a luminescent
24	sample comprising GTLS which provides a light
25	output of pre-determinable intensity and colouring
26	means to alter the colour of the light output to
27	produce a coloured light output.
28	
29	According to a further aspect of the present
30	invention there is provided a method of calibrating
31	light measuring apparatus, comprising the steps of;
32	

1	placing a luminescent device comprising
2	gaseous tritium light source (GTLS) which
3	provides a light output of pre-determinable
4	intensity in the apparatus; and
5	
6	adjusting the reading of light output of the
7	apparatus to the pre-determined intensity of
8	the light output of the luminescent device.
9	
10	Where the luminescent device comprises colouring
11	means to alter the colour of the light output to
12	produce a coloured light output, the apparatus
13	tested may be colourimetric equipment.
14	
15	According to a further aspect of the present
16	invention there is provided a light measuring
17	apparatus comprising a luminescent calibration
18	device comprising GTLS, wherein the luminescent
19	calibration device is housed in a sample holder of
20	the apparatus.
21	
22	According to a further aspect of the present
23 .	invention there is provided a method of analysing a
24	sample, said method comprising the steps of;
25	i) calibrating an apparatus able to detect light
26	output using a device as described above;
27	ii) inserting said sample into the calibrated
28	apparatus and obtaining a reading therefor.
29	
30	The sample may be any suitable sample comprising
31	molecules and/or living cells. Usually the
32	apparatus will be able to quantify the light output

reading and may be for example, a luminometer, a 1 fluorometer, a spectrophotometer, a scintillation 2 counter, a photomultiplier, a photodiode (like an 3 avalanche photodiode) or a CCD camera. The method 4 may be applicable for techniques including drug 5 discovery, high throughput screening (especially 6 using a light reporter), molecular biology and 7 diagnostic applications, but other uses are not 8 excluded. 9 10 The present invention will now be described by way 11 of example only with reference to the accompanying 12 drawings in which; 13 14 Figure 1 show a side view of a GLTS insert within 15 an inner housing formed from a material such as 16 aluminium, brass, plastics or the like. 17 18 Figure 2 shows a cross-sectional side view of the 19 inner housing containing the GTLS of Fig.1. 20 21 Figure 3 shows a perspective view of the inner 22 housing of Figs. 1 and 2. 23 24 Figure 4 shows the light output from the device of 25 26 Figs. 1 to 3. 27 Figure 5 is a cross-sectional view of a device 28 according to the invention having the housing of 29 Figs. 1 to 4 located within an outer casing and 30 with a filter located thereon. 31

32

With reference to the Figures, Figures 1 to 5 show

5 an exemplary luminescent device according to the

6 present invention designed for use in 96 well

7 plates. The luminescent device (1) is constructed

8 with an outer casing (6) constructed from stainless

steel (416). The outer casing is susceptible to a

nagnetic field which enables the device to be

easily extracted from the 96 well plate using a

magnetic handling tool (for example as shown in

13 Figures 24 and 25). The gaseous tritium light

14 source (GSLS) (3) is fixed in place within an inner

15 housing (2) using a silicon based adhesive. An

16 aperture (4) in the top of housing (2) allows light

17 to be admitted (see arrows at Figure 4) and since

18 the aperture is of a given diameter this means that

19 the light output is uniform. The GTLS (3) within

the housing (2) as shown in Figures 1 to 4 may be

located within the outer casing (6) using an

22 adhesive. A filter (5) formed of glass or other

23 material is then secured across the aperture (4)

24 for example using adhesive. The filter (5) can be

of different optical density and exemplary filters

26 include neutral density filters of 1.0 giving 10%

27 transmission, neutral density filter of 2.0 giving

28 1% transmission of neutral density filter of 3.0

29 giving 0.1% transmission. Coloured filters may

30 alternatively be used to filter what light of a

31 specific wavelength.

15

An alternative embodiment of the present invention 1 2 is shown in Figures 6 and 7 and illustrator modified design for the luminescent device for a 3 394 well plate. Figure 6 shows an outer cases (6) 4 which may conveniently be formed of magnetic metal, 5 6 such as stainless steel. The size of the outer 7 casing will be selected for insertion into an individual well of a 384 well plate but typically 8 the length of the casing shown in Figure 6 would be 9 10 approximately 9mm. Figure 7 illustrates the formed device with the GTLS 3 being prelocated into a 11 tubular housing (2) which may for example be 12 aluminium. One end of the tubular housing (2) 13 maybe sealed using a suitable sealant, for example 14 silicon glue (8). The opposite end of the inner 15 16 housing (2) may be sealed with a transparent or 17 translucent material (9) for example glass, such as 18 saphire glass. A glass filter (5) is placed over the free end of the inner housing such that light 19 is emitted through aperture (7) of the outer casing 20 (6). 21 22 An alternative embodiment of luminescent device 23 according to the present invention is illustrated 24 in Figure 9 and is suitable for use in PCR or 25 conical well plates. An outer housing (6) is shown 26 in Figure 8 and again an inner housing (2) similar 27 28 to that illustrated in Figures 1 to 4 is present 29 and contains the GTLS (3) a filter (5) is located over the top of the inner housing (2) and light is 30 emitted through apertures (4) and (7). 31

Figures 10 to 13 illustrate a luminescent device 1 according to the present invention designed for 2 calibration of a microscope, CCD camera or other 3 imaging system. In this embodiment the GTLS kit 4 (3) is located within an inner housing (2) and is 5 secured therein either through the internal size 6 and shape of the inner housing (2) and/or through 7 the use of an adhesive. A filter (5) is located 8 over the GTLS. An exemplary filter having an array 9 of different neutral densities thereon is 10 illustrated in Figure 13 and demonstrates the 11 option of having different light outputs with a 12 single GTLS lightsources. At each end of the 13 neutral density filter array is a small bar (10 and 14 10') in which the light is not filtered for 15 comparative purposes. 16 17 Figures 14 to 17 illustrate an alternative 18 embodiment of the present invention in which the 19 luminescent device can be used as a self 20 luminescence scale bar or graticule calibration 21 The longitudinal cross section, lateral 22 device. cross section and top view are similar to those of 23 Figures 10, 11 and 12, but Figure 17 shows an 24 alternative exemplary filter in which a scale bar 25 26 graticule has been etched thereon using lithography 27 or mask techniques (similar to those used during production of a semi-conductor chip) and in which 28 the scale can be selected from millimetres to 29 30 micrometers.

- Figure 18 shows data from a calibration device over 1 24 hours measured using a Mithras LB 940 2 luminometer (Berthold). Three different devices 3 4 according to the present invention were measured, each having a different density filter thereon. 5 The devices are labelled A, B and C in the graph. 6 7 Each device was measured for 0.1 seconds, at 360 second intervals over 24 hours. 8 The average intensity of calibration device A was 1011763 9 10 relative light units (RLU); B equals 99163 RLU and C equals 27326 RLU. 11 12
- 13 Figures 19 to 23 illustrate the option of laser
  14 etching a luminescent device according to the
  15 present invention. Each device is labelled with
  16 the product type and with a unique serial number.
  17 Such labelling allows the luminescent device to the
  18 calibrated manufacture and to trace throughout its
  19 lifetime.

Figures 24 and 25 illustrate an exemplary magnetic 21 handling tool for extracting luminescent devices 22 according to the present invention and having a 23 magnetic component within their manufacture from 24 25 well plates, for example from 96 or 384 well In the exemplary magnetic handling tool a 26 neodymium disk magnet is fixed into a magnetic rod. 27 Other magnet types could alternatively be used. 28

29

Figure 26 illustrates the devices according to the present invention (the devices as illustrated in Figure 18) in use in a 96 well plate. In sample A1

- 1 (corresponding to sample A of Figure 18) the light
- 2 intensity of the GTLS is strong and the GTLS is
- 3 clearly visible. In sample A2 (corresponding to
- 4 sample B in Figure 18) a greater degree of
- 5 filtering has been applied and in sample A3
- 6 (corresponding to sample C in Figure 18) the
- 7 filtering has again been increased.

PCT/GB2004/000229

WO 2004/065511

1	Clair	<u>ms</u>
2		
3	1.	A luminescent device comprising a gaseous
4		tritium light source (GTLS) which provides a
5		light output of pre-determinable intensity.
6		
7	2.	A device according to Claim 1, wherein the GTLS
8		comprises 10 to 20 mCi of tritium.
9		
10	3.	A device according to either one of Claims 1
11		and 2, wherein the GTLS is located with an
12		outer casing having at least one optically
13		transparent or translucent portion.
14		
15	4.	A device according to Claim 3, wherein the
16		outer casing is steel.
17		
18	5.	A device according to either one of Claims 3
19		and 4, wherein the transparent or translucent
20		portion comprises a neutral density filter.
21		
22	6.	A device according to any one of Claims 3 to 5,
23		wherein the transparent or translucent portion
24		is formed from glass or plastic.
25		
26	7.	A device according to any one of Claims 1 to 6,
27		wherein the device further comprises colouring
28		means to alter the colour of the light output
29		of the GTLS.
30		

1 8. A device according to any one of Claims 1 to 7, 2 wherein the GTLS is held within a housing, the housing being located in the outer casing. з . 4 9. A device according to any one of Claims 1 to 8, 5 6 which is sized and shaped to calibrate the 7 optical output of scientific apparatus. 8 A device according to Claim 9, wherein said 10. 9 apparatus is a luminometer, a fluorometer, a 10 11 spectrophotometer, a scintillation counter, a photomultiplier, an avalanche photodiode or a 12 CCD camera. 13 14 15 11. A device according to any one of Claims 1 to 8, wherein said device comprises a scalebar 16 17 graticule. 18 A device according to any one of Claims 1 to 8, 12. 19 wherein said device comprises a filter array. 20 21 A kit comprising two or more luminescent 22 13. devices according to any one of Claims 1 to 12, 23 each said device providing a light output of a 24 distinct intensity to the other devices of said 25 26 kit. 27 A kit according to Claim 13, further comprising 28 14. a magnetic handling tool and wherein each said 29 device includes a magnetic component. 30 31

1	12.	A RIT according to either one of Claims 12 and
2	•	13, comprising three or more devices, each
3		having a light output of a distinct intensity
4		to the other devices of said kit.
5		
6	16.	A light measuring apparatus comprising a
7		luminescent device as claimed in any one of
8		Claims 1 to 12, housed in a sample holder of
9		said apparatus.
10		
11.	17:	An apparatus as claimed in Claim 16, which is a
12		luminometer, a fluorometer, a
13		spectrophotometer, a scintillation counter, a
14		photomultiplier, an avalanche photodiode or a
15		CCD camera.
16		
17	18.	A method of analysing a sample, said method
18		comprising;
19		i) calibrating an apparatus able to detect
20		light output using a device as claimed in
21		any one of Claims 1 to 12;
22		ii) inserting said sample into the calibrated
23		apparatus and obtaining a reading
24		therefore.
25		
26	19.	A method as claimed in Claim 18, wherein the
27		sample comprises living cells.
